DETAILED ACTION

1. The application filed March 3, 2004 is presented for examination and claims 1-13 are pending.

Allowable Subject Matter

2. Claims 1 to 13 are allowed.
3. The following is an examiner's statement of reasons for allowance: the claimed invention is directed to an image display device.

Independent claim 1 identifies a uniquely distinct feature "a first potential difference between a voltage of pixel electrodes of the dummy pixels to which a given gray scale voltage of positive polarity is written among the plurality of dummy pixels and a common voltage applied to the common electrodes corresponding to the dummy pixels is detected, a second potential difference between a voltage of pixel electrodes of the dummy pixels to which a given gray scale voltage of negative polarity is written among the plurality of dummy pixels and the common voltage applied to the common electrodes corresponding to the dummy pixels is detected, and the voltage applied to the common electrodes is controlled so as to make the first potential difference and the second potential difference equal to each other".

Independent claim 7 identifies a uniquely distinct feature "a first means which detects a potential difference between a voltage of the pixel electrodes of the dummy pixels to which a given gray scale voltage of positive polarity is written among the

plurality of dummy pixels and a common voltage applied to common electrodes, a second means which detects a potential difference between a voltage of the pixel electrodes of the dummy pixels to which a given gray scale voltage of negative polarity is written among the plurality of dummy pixels and the common voltage applied to the common electrodes, and a control means which controls the voltage applied to the common electrodes so as to make the first potential difference detected by the first means and the second potential difference detected by the second means equal to each other”.

Independent claim 13 identifies a uniquely distinct feature “a voltage applied to the common voltage is controlled so as to make a potential difference between a voltage of pixel electrodes of the dummy pixels to which a given gray scale voltage of positive polarity is written among the plurality of dummy pixels and a common voltage applied to the common electrodes and a potential difference between a voltage of pixel electrodes of the dummy pixels to which a given gray scale voltage of negative polarity is written among the plurality of dummy pixels and the common voltage applied to the common electrodes equal to each other”.

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Tsuda et al. (20020180673), Maruoke et al. (20020186192), and Magayama et al. (20030107698).

The closest art, Tsuda et al., Maruoke et al., and Magayama et al. as discussed above, either singularly or in combination, fail to anticipate or render obvious the above limitations obvious.
